

Northstar Clinics - Support Backlog Summary

Operating summary prepared for Ops Pilot OCR/text extraction demo. Text-based PDF with structured tables.

Support Volume and Backlog Trend

Metric	Current Value	Trend / Note	Operational Implication
Open support backlog	1,240 tickets	Up 34% over the last quarter	Backlog growth may reduce response quality and customer satisfaction.
Median first response time	18 hours	Up from 9 hours last quarter	Response delays may affect early customer confidence.
Repeat onboarding questions	42% of onboarding tickets	Same setup and workflow questions repeat across customers	Knowledge-base or assistant workflow may reduce repeated CS work.
Tickets from first 30 days after kickoff	48% of total support volume	Highest load during implementation and activation	First-month onboarding support is a likely automation target.
Escalations to implementation team	27% of onboarding tickets	Often caused by missing setup details or EHR mapping questions	Better intake and routing could reduce handoff friction.

Support Notes

Support managers report that many tickets are caused by customers not knowing which onboarding step is next. Slack threads and spreadsheets are used to track blocked accounts, but no single workflow owner has a reliable stuck-account view.

Missing Data to Request

Missing Item	Why It Matters
Ticket volume by customer segment	Needed to identify whether mid-market clinics or regional groups drive most support load.
Ticket resolution time by issue type	Needed to estimate where automation could reduce work.
Customer satisfaction by onboarding cohort	Needed to connect support backlog to customer experience.
